Note: This table shows 10 columns from the Dictator Game results applying Random effects using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown. Column 1 and 2 contains the total sample, the rest of them restricts the sample to each of the actors that interacts with the participant: None(C12), Displaced(D), ExFarc(E) and Migrant(R). For each sample segmentation there is a specification without controls and another with all the sociodemographic variables.

Note: This table shows 10 columns from the Dictator Game results applying Random effects using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample,the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation there is a specification without controls and another with all the sociodemographic variables.

Source: Own calculations.

Table 9: Trust Game

Note: The 10 columns shows the Trust Game results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over three tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample, the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation there is a specification without controls and another with all the sociodemographic variables.

The 10 columns shows the Third-Party Redistribution Game with Merit results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant like control(tourism), Ex-Farc or Migrants. All the coefficients are read against non video shown. Column 1 an 2 contains the total sample, the rest of them restricts the sample to each of the pairs of actors that interacts with the participant:None(C12), Displaced(D), Ex-Farc(E) and Migrant(R). For each sample segmentation there is a specification without controls and another with all the sociodemographic variables

The 10 columns shows the Third-Party Redistribution Game with Merit results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant like control(tourism), Ex-Farc or Migrants. All the coefficients are read against non video shown. Column 1 an 2 contains the total sample, the rest of them restricts the sample to each of the pairs of actors that interacts with the participant:None(C12), Displaced(D), Ex-Farc(E) and Migrant(R). For each sample segmentation all sociodemographic variables are included.

Source: Own calculations.

Note: This table shows 10 columns from the Dictator Game results applying Random effects using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample,the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.

Source: Own calculations.

Table 17: Trust Game-Heterogeneous effects with wealth variable

Note: This table shows 10 columns from the Dictator Game results applying Random effects using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample,the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.

Source: Own calculations.

Note: The 10 columns shows the Trust Game results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over three tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample, the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included. .

The 10 columns shows the Third-Party Redistribution Game with Merit results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant like control(tourism), Ex-Farc or Migrants. All the coefficients are read against non video shown. Column 1 an 2 contains the total sample, the rest of them restricts the sample to each of the pairs of actors that interacts with the participant:None(C12), Displaced(D), Ex-Farc(E) and Migrant(R). For each sample segmentation all sociodemographic variables are included.

Source: Own calculations.

Table 24: Dictator Game-Heterogeneous effects with wealth and Ideology variables
