Overcoming empathy failures to improve trust: Experimental evidence from Colombia *

Abstract

In the last few years, Colombia has faced a wave of four million migrants entering the country from Venezuela. This adds to internally displaced people (IDPs), victims of the civil conflict, former combatants of the FARC and paramilitaries that have rejoined civilian life.

When inequalities in social environments are substantial, they affect the quality of social interactions and economic outcomes. Although trust is understood as key for development, little is known about the role of trust in the presence of conflict between groups and inequality. Trust may succeed in overcoming collective action problems only if beliefs about out group members' willingness or ability to integrate with the in group members are present, prejudice is reduced and empathy improved.

We implement a lab-in-the-field experiment with a representative sample in the main Colombian regions to measure Colombian citizens' prosocial behavior (i.e. altruism, trust, and preferences for redistribution) towards four groups: Venezuelan migrants, former combatants, internally displaced people and the very poor.

The aim of this study is twofold. First, we explore the role of trust within a specific society with persistent inequality and empathy barriers between groups. Second, we show the benefits of interventions based on social psychology insights on improving trust.

Our behavioral informed intervention is a 5-minute media intervention we created from interviews we conducted with Venezuelans and Colombians in a slum in Bogotá. A second media intervention was created by **?** and uses interviews with FARC ex-combatants in a Colombian demobilization camp and non-FARC Colombians in neighboring communities. The videos are not a priming mechanism but an informative and learning one that reduces psychosocial barriers. We show that exposure to the media interventions humanizes FARC ex-combatants, affected both attitudes (e.g., support for inclusive policies) and prosocial behavior toward them and IDPs.

JEL classification: A13, C72, C90, D91

Keywords: lab in the field experiments, media, other-regarding preferences, altruism, trust, post-conflict, dehumanization

Note: This table shows 10 columns from the Dictator Game results applying Random effects using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample,the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation there is a specification without controls and another with all the sociodemographic variables.

Note: This table shows 10 columns from the Dictator Game results applying Random effects using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample,the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation there is a specification without controls and another with all the sociodemographic variables.

Source: Own calculations.

Note: The 10 columns shows the Trust Game results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over three tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample, the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation there is a specification without controls and another with all the sociodemographic variables.

5

Note: The 16 columns shows Third-Party Redistribution Game with Luck results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variables represent the video shown to the participant like control(tourism), Ex-Farc or Migrants) All the coefficients are read against non video shown. Column 1 contains the total sample, Column 2,3,4,5,6,7 and 8 restricts the sample to each of pairs of actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R). For each sample segmentation there is a specification without controls and another with all the sociodemographic variables.
Source: Own calculations.

The 10 columns shows the Third-Party Redistribution Game with Merit results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant like control(tourism), Ex-Farc or Migrants. All the coefficients are read against non video shown. Column 1 an 2 contains the total sample, the rest of them restricts the sample to each of the pairs of actors that interacts with the participant:None(C12), Displaced(D), Ex-Farc(E) and Migrant(R). For each sample segmentation there is a specification without controls and another with all the sociodemographic variables

The 10 columns shows the Third-Party Redistribution Game with Merit results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant like control(tourism), Ex-Farc or Migrants. All the coefficients are read against non video shown. Column 1 an 2 contains the total sample, the rest of them restricts the sample to each of the pairs of actors that interacts with the participant:None(C12), Displaced(D), Ex-Farc(E) and Migrant(R). For each sample segmentation all sociodemographic variables are included.

Source: Own calculations.

Table 13: Dictator Game-Heterogeneous effects with income variable

Note: This table shows 10 columns from the Dictator Game results applying Random effects using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample,the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.
Source: Own calculations.

Table 14: Trust Game-Heterogeneous effects with income variable

Note: The 10 columns shows the Trust Game results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over three tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample, the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included. .

11

Note: The 16 columns shows Third-Party Redistribution Game with Luck results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variables represent the video shown to the participant like control(tourism), Ex-Farc or Migrants) All the coefficients are read against non video shown. Column 1 contains the total sample, Column 2,3,4,5,6,7 and 8 restricts the sample to each of pairs of actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.
Source: Own calculations.

Table 16: Third-Party Redistribution Game with Merit-Heterogeneous effects with income variable

The 10 columns shows the Third-Party Redistribution Game with Merit results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant like control(tourism), Ex-Farc or Migrants. All the coefficients are read against non video shown. Column 1 an 2 contains the total sample, the rest of them restricts the sample to each of the pairs of actors that interacts with the participant:None(C12), Displaced(D), Ex-Farc(E) and Migrant(R). For each sample segmentation all sociodemographic variables are included.

Note: The 10 columns shows the Trust Game results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over three tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample, the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included. .

Note: The 16 columns shows Third-Party Redistribution Game with Luck results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variables represent the video shown to the participant like control(tourism), Ex-Farc or Migrants) All the coefficients are read against non video shown. Column 1 contains the total sample, Column 2,3,4,5,6,7 and 8 restricts the sample to each of pairs of actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.
Source: Own calculations.

Note: This table shows 10 columns from the Dictator Game results applying Random effects using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample,the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.

Note: The 16 columns shows Third-Party Redistribution Game with Luck results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variables represent the video shown to the participant like control(tourism), Ex-Farc or Migrants) All the coefficients are read against non video shown. Column 1 contains the total sample, Column 2,3,4,5,6,7 and 8 restricts the sample to each of pairs of actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.
Source: Own calculations.

Note: This table shows 10 columns from the Dictator Game results applying Random effects using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample,the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.
Source: Own calculations.

Table 30: Trust Game-Heterogeneous effects with income variable and tendency towards leftist ideology.

Note: The 10 columns shows the Trust Game results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over three tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample, the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included. .

Source: Own calculations.

Table 31: Third-Party Redistribution Game with Luck-Heterogeneous effects with income variable and tendency towards leftist ideology.

Note: The 16 columns shows Third-Party Redistribution Game with Luck results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variables represent the video shown to the participant like control(tourism), Ex-Farc or Migrants) All the coefficients are read against non video shown. Column 1 contains the total sample, Column 2,3,4,5,6,7 and 8 restricts the sample to each of pairs of actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.
Source: Own calculations.

Table 32: Third-Party Redistribution Game with Merit-Heterogeneous effects with income variable and tendency towards center ideology.

The 10 columns shows the Third-Party Redistribution Game with Merit results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant like control(tourism), Ex-Farc or Migrants. All the coefficients are read against non video shown. Column 1 an 2 contains the total sample, the rest of them restricts the sample to each of the pairs of actors that interacts with the participant:None(C12), Displaced(D), Ex-Farc(E) and Migrant(R). For each sample segmentation all sociodemographic variables are included.

The 10 columns shows the Third-Party Redistribution Game with Merit results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant like control(tourism), Ex-Farc or Migrants. All the coefficients are read against non video shown. Column 1 an 2 contains the total sample, the rest of them restricts the sample to each of the pairs of actors that interacts with the participant:None(C12), Displaced(D), Ex-Farc(E) and Migrant(R). For each sample segmentation all sociodemographic variables are included.

Source: Own calculations.

Table 37: Dictator Game-Heterogeneous effects with income variable and tendency towards center ideology.

Note: This table shows 10 columns from the Dictator Game results applying Random effects using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample,the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.
Source: Own calculations.

Table 38: Trust Game-Heterogeneous effects with income variable and tendency towards center ideology.

Note: The 10 columns shows the Trust Game results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over three tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample, the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included. .

Source: Own calculations.

Table 39: Third-Party Redistribution Game with Luck-Heterogeneous effects with income variable and tendency towards center ideology.

Note: The 16 columns shows Third-Party Redistribution Game with Luck results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variables represent the video shown to the participant like control(tourism), Ex-Farc or Migrants) All the coefficients are read against non video shown. Column 1 contains the total sample, Column 2,3,4,5,6,7 and 8 restricts the sample to each of pairs of actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.
Source: Own calculations.

Table 40: Third-Party Redistribution Game with Merit-Heterogeneous effects with income variable and tendency towards center ideology.

The 10 columns shows the Third-Party Redistribution Game with Merit results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant like control(tourism), Ex-Farc or Migrants. All the coefficients are read against non video shown. Column 1 an 2 contains the total sample, the rest of them restricts the sample to each of the pairs of actors that interacts with the participant:None(C12), Displaced(D), Ex-Farc(E) and Migrant(R). For each sample segmentation all sociodemographic variables are included.

The 10 columns shows the Third-Party Redistribution Game with Merit results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant like control(tourism), Ex-Farc or Migrants. All the coefficients are read against non video shown. Column 1 an 2 contains the total sample, the rest of them restricts the sample to each of the pairs of actors that interacts with the participant:None(C12), Displaced(D), Ex-Farc(E) and Migrant(R). For each sample segmentation all sociodemographic variables are included.

Source: Own calculations.

Table 45: Dictator Game-Heterogeneous effects with income variable and tendency towards right ideology.

Note: This table shows 10 columns from the Dictator Game results applying Random effects using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample,the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.
Source: Own calculations.

Table 46: Trust Game-Heterogeneous effects with income variable and tendency towards right ideology.

*** p<0.01, ** p<0.05, * p<0.1

Note: The 10 columns shows the Trust Game results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over three tokens. The treatment variable represent the video shown to the participant that corresponds to control(neutral video), ExFarc(TE) or Migrants(TR). All the coefficients are read against non video shown.Column 1 and 2 contains the total sample, the rest of them restricts the sample to each of the actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included. .

Source: Own calculations.

Table 47: Third-Party Redistribution Game with Luck-Heterogeneous effects with income variable and tendency towards center right.

Note: The 16 columns shows Third-Party Redistribution Game with Luck results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variables represent the video shown to the participant like control(tourism), Ex-Farc or Migrants) All the coefficients are read against non video shown. Column 1 contains the total sample, Column 2,3,4,5,6,7 and 8 restricts the sample to each of pairs of actors that interacts with the participant:None(C12),Displaced(D),ExFarc(E)and Migrant(R).For each sample segmentation all sociodemographic variables are included.
Source: Own calculations.

Table 48: Third-Party Redistribution Game with Merit-Heterogeneous effects with income variable and tendency towards right ideology.

The 10 columns shows the Third-Party Redistribution Game with Merit results applying Random effects Models using between regression estimators, The Dependent variable is the percentage distribution of the participant over five tokens. The treatment variable represent the video shown to the participant like control(tourism), Ex-Farc or Migrants. All the coefficients are read against non video shown. Column 1 an 2 contains the total sample, the rest of them restricts the sample to each of the pairs of actors that interacts with the participant:None(C12), Displaced(D), Ex-Farc(E) and Migrant(R). For each sample segmentation all sociodemographic variables are included.
